Why should I clean my Windows PC?

Keeping system clutter under control can be important to PC health. If not regularly cleaned, at the minimum, junk files can cause the computer to undergo superfluous and wasteful

processing. PC cleanup is one of the most important parts of computer maintenance. Remember that the more free space there is, the faster your computer will run. Performing PC cleanup is important because Windows accumulates unnecessary junk files that reduce computer performance. These files are just like the junk hidden deep in your wardrobe – you can't see it, but it's still there and it's wasting space. So how do they get created in the first place? Most Windows programs create temporary files for a number of purposes, but mostly when a program needs more memory for its tasks or when a program is working with large chunks of data. Programs like Microsoft Office also create temporary files and use them for keeping a copy of your data in case the program crashes. In the perfect world, temporary files would be deleted automatically when the programs close. Unfortunately, sometimes things go wrong. Poorly written applications, improper shutdowns, and freeze-ups often leave temp files behind. That's how gigabytes of clutter can be created. Another type of temporary files is Temporary Internet Files. These files are created by the browser and are often kept for a lot longer than necessary. Deleting junk files is easy enough – all you need to do is run WinUtilities Pro.
